# Network engineering

CONTOSO FICTIONAL DEMO - approved content for this scenario only.

Source-ID: KB-NET | Version: v2 | APPROVED | Effective: 2026-10-01 | Scenario: 2026-10-13

## Section 1

Fictional engineering specification: CMS-48P-POE has 48 PoE ports, 1G uplinks and a 740 W budget. CMS-48X-POE has 48 PoE ports, 10G uplinks and a 960 W budget. A 32 x 30 W load consumes the full 960 W before headroom; final design needs a measured diversity/headroom decision.

## Section 2

CAP-7 is the proposed Wi-Fi 7 alternative to CAP-6E. Compatibility, radio regulations, coverage and client roaming must be validated in a survey and pilot. CSFP-10G needs fiber-distance and switch compatibility confirmation. These are demo KB specifications, not visible Atlas measurements.

## Section 3

Gaps: no independent throughput, roaming, PoE load, optics interoperability, rack/cooling or restore test is supplied. 802.1X, guest ACLs and QoS are design requirements, not proven as deployed.
